

ABSTRACT

In network printing system including workstations and printers interconnected by a network, remotely generated interactive print jobs are stored at the printer and activated from a workstation either through a network-specific interface or a web-browser-based interface. Interactive print jobs are print jobs that are automatically stored in the printer memory and not printed unless they are explicitly activated by a user. Interactive print jobs waiting to be activated are upon request listed on the display screen of the workstation and may be selected by the user. Upon a print command issued at the workstation in respect of one or more selected print jobs, the job data are fetched from the local printer storage and processed by the printer.
